ACADEMIND

Building Custom Hooks

Re-using Logic

```
import React, { useState, useEffect, useReducer, useContext } from 'react';

import Card from '../UI/Card/Card';
import classes from './Login.module.css';
import Button from '../UI/Button/Button';
import AuthContext from '../../store/auth-context';

const emailReducer = (state, action) => {
  useState();
```

```
(alias) useState<undefined>(): [undefined, React.Dispatch<(prevSta
te: undefined) => undefined>] (+1 overload)
import useState
```

Returns a stateful value, and a function to update it.

@version — 16.8.0

ACADEMIND

Rules of Hooks

Only call React Hooks in **React Functions**

- React Component Functions
- Custom Hooks (covered later!)

Only call React Hooks at the **Top Level**

- Don't call them in nested functions
- Don't call them in any block statements

+ extra, unofficial Rule for **useEffect()**: ALWAYS add everything you refer to inside of useEffect() as a dependency!

ACADEMIND

Module Content

What & Why?

Building a Custom Hook

Custom Hook Rules & Practices

ACADEMIND

What are “Custom Hooks”?

Outsource **stateful** logic into **re-usable functions**

Unlike "regular functions", custom hooks can use other React hooks and React state
